BUSINESS INTELLIGENCE & TRANSFORMATION PLATFORM

Technical Architecture & System Specification

v1.0 • February 2026 • CONFIDENTIAL

This document defines the complete technical architecture for the AI-powered business intelligence and transformation platform. It synthesizes the product vision across both SMB and Enterprise tiers, the three-phase operational model (Ingest → Plan → Execute), and the multi-agent system that delivers continuous, actionable intelligence to business owners and leadership teams.

The platform replaces the fragmented advisory infrastructure most businesses rely on — strategy consultants, BI tools, people analytics, competitive research, and the owner's own time — with a single, continuously learning system that ingests everything, understands everything, and acts on everything.

1. SYSTEM OVERVIEW

The platform operates across three sequential phases, each building on the output of the one before it. The system is designed so that a business can go from zero integration to fully autonomous operation through a progressive trust model: first it observes, then it advises, then it acts.

1.1 The Three Phases

PHASE	PURPOSE	DESCRIPTION
INGEST	Understand the Business	Consume every data source, communication channel, and raw document the business has. Categorize, summarize, and build a complete knowledge graph of the organization.
PLAN	Diagnose & Strategize	Produce the core deliverables: Business Health Score, issues register, strategy documents, action plans, revenue leak analysis, cash intelligence, competitive blind spots, and a day-by-day execution roadmap.
EXECUTE	Act & Operate	Deploy specialized agents (Coach, Developer, Sales/Marketing, Transformation) under an Orchestrator that ensures every action aligns with the approved plan. Runs continuously with cron jobs, master task lists, and a decision platform for stakeholder oversight.

1.2 Market Tiers

	SMB TIER	ENTERPRISE TIER
Revenue Range	$1M – $100M	$50M – $1B+
Core Deliverables	8 deliverables: Health Score, Cash Intelligence, Revenue Leak, Customer Health, Decision Intelligence, Team Intelligence, Competitive Intel, Growth Roadmap	11 deliverables: Adds Hard Truths Report, Board/Investor Pack, AI Transformation Roadmap, Risk/Compliance/Resilience Assessment
Onboarding	60-minute discovery session, 3 data connections, 30 minutes/week ongoing	90-minute discovery session, 3+ data connections, designated point of contact, 1 hour/week
Replaces	$58K–$220K/year in fragmented advisory spend	$980K–$3.45M/year in consulting, BI, analytics, and reporting costs

2. PHASE 1: INGEST

The Ingest phase is the foundation of the entire system. Its purpose is to consume, read, categorize, and structure every piece of information the business has — to the same depth a top-tier consulting agency would require if they were given full access. Nothing is optional; the system needs everything.

2.1 Data Source Categories

CATEGORY	SOURCES	EXAMPLES
Data Sources	Databases, APIs, system credentials, accounting software, CRM, ERP, HRIS, payment processors	Xero, QuickBooks, Salesforce, HubSpot, Stripe, Gusto, BambooHR, custom databases with connection strings
Communication Channels	Team messaging, email, client communication platforms, exported chat histories	Slack, Microsoft Teams, WhatsApp (exported chats), email archives, support ticket systems, Intercom, Zendesk
Raw Information	Unstructured documents, spreadsheets, presentations, contracts, reports, board packs	PDFs, Excel files, Word docs, Google Sheets, slide decks, financial statements, strategy documents, employee records

2.2 Onboarding Portal

The system requires a web-based onboarding portal where every team member logs in and contributes their piece of the picture. This is a time-boxed process — once the contribution window closes, the system transitions to the Plan phase.

Portal Requirements

Secure authentication: Each team member creates an account, authenticates, and is assigned a role-based access level.

Credential vault: Encrypted storage for API keys, database passwords, OAuth tokens, and system credentials. The platform needs the same access a hired consultant would receive.

Document upload interface: Drag-and-drop for any file type. Each team member uploads documents relevant to their function — financial reports, contracts, org charts, customer lists, strategy docs.

Communication channel connectors: OAuth integrations for Slack, Teams, email. WhatsApp chat export upload. The goal is to capture the communication patterns and content that reveal how the business actually operates.

Time-boxed contribution window: A defined period (e.g. 5–10 business days) during which all stakeholders add their data. When the window closes, the system has everything it needs and begins synthesis.

2.3 The Ingestion Agent

This is the first agent of the platform. It is not a simple pipeline — it is an investigative agent with full context that processes every piece of information and builds a structured understanding of the business.

Processing Flow

The agent operates through a series of flows (not necessarily sub-agents — these can be deterministic processing steps):

Step 1 — Read: Every piece of information is read and parsed. Documents are OCR'd if needed, structured data is queried, communications are transcribed.

Step 2 — Summarize: Each item gets a structured forward: summary description, key points extracted, entities identified (people, amounts, dates, relationships).

Step 3 — Categorize: Each item is categorized against a predefined schema of business dimensions (see below), plus free-form categories for anything that doesn't fit the expected schema.

Step 4 — Synthesize: All categorized information is fed into a high-context agent (or large-context model) that has visibility across everything. This agent conducts its own investigation — cross-referencing data, identifying gaps, flagging contradictions, and building the complete business picture.

Predefined Schema Categories

The system maintains a schema of expected business dimensions that it actively tries to fill:

DIMENSION	INFORMATION TARGETS
Team Structure	Org hierarchy, reporting lines, team sizes, department structure, key personnel
Compensation & HR	Salary data, benefits, tenure, performance reviews, satisfaction signals
Financial Position	P&L, balance sheet, cash position, accounts receivable/payable aging, burn rate
Revenue Model	Pricing structure, customer segments, contract types, recurring vs. project revenue
Customer Portfolio	Client list, revenue per client, concentration risk, contract terms, satisfaction data
Operations	Core processes, tools used, workflows, bottlenecks, capacity utilization
Sales & Pipeline	Pipeline data, conversion rates, deal sizes, sales cycle length, lead sources
Market & Competition	Competitor names, positioning, pricing intelligence, market dynamics
Strategy & Planning	Current strategy documents, goals, OKRs, board materials, investor commitments
Risk & Compliance	Regulatory obligations, insurance, legal exposure, contract risk

Anything that does not map to the predefined schema gets categorized dynamically. Every item — whether schema-matched or free-form — must have a description, key points, and a category assignment. Nothing is discarded.

3. PHASE 2: PLAN

The Plan phase is where the Ingestion Agent's output is transformed into actionable intelligence. This is the most critical phase to get right — the outputs must be hyper-personalized, brutally honest, and aggressively specific. No fluff. No generic advice. Every finding must name the specific problem, the specific dollar amount, and the specific action.

3.1 Core Outputs

The Plan phase produces the following deliverables, which form the strategic foundation for everything that follows:

A. Business Health Score (0–100)

A single composite score broken down across five dimensions (SMB) or six dimensions (Enterprise): cash/financial health, revenue/growth momentum, customer stability, people/team, competitive position, and technology readiness (Enterprise). Benchmarked against industry peers. Updated continuously after initial generation.

B. Issues Register

Every problem the system identifies, ranked by severity and financial impact. Named, numbered, and dollar-denominated where possible. This includes: revenue leaks, pricing gaps, customer churn risk, cash timing problems, team flight risks, operational bottlenecks, competitive blind spots, and compliance exposures.

C. Strategy Documents

The platform's assessment of where the business is, where it needs to be, and the gap between the two. Includes the Hard Truths Report (Enterprise) — beliefs the leadership team holds that the data does not support. This document must not pull punches; it exists to tell the business what no one else will.

D. Action Plan (Day-by-Day)

This is the most distinctive output of the Plan phase. The system generates a literal day-by-day execution plan covering however many weeks or months it determines the transformation will take. Each day has specific tasks, owners, dependencies, and expected outcomes. The plan includes the path from current Health Score to 100.

3.2 Intelligence Deliverables

In addition to the core strategic outputs, the Plan phase generates the full suite of intelligence products:

DELIVERABLE	SPECIFICATION
Cash Survival Intelligence	13-week (SMB) and 52-week (Enterprise) cash flow model. Flags timing risks, payment concentrations, slow-paying accounts, unnecessary recurring spend. Names the exact week problems hit and what to do about them.
Revenue Leak Analysis	Dollar-denominated identification of pricing gaps, undercharged customers, missed upsells, and pre-churn revenue at risk. Includes a sequenced recovery plan with projected quarterly impact.
Growth Intelligence	Market expansion simulation, adjacent segment analysis, highest-probability revenue growth opportunities. Prioritized list of what to focus on in the next 90 days.
Early Warning Systems	Customer churn prediction (60–90 days advance warning), employee attrition risk scoring, cash crunch detection, competitive move alerts. All automated, all continuous.
Competitive Blind Spots	What competitors are doing that the business hasn't noticed: pricing changes, hiring signals, technology shifts, messaging pivots,

	partnership moves. Translated into specific response recommendations.
Board & Investor Pack	(Enterprise) Auto-generated quarterly board pack with Health Score, financial performance vs. forecast, pipeline intelligence, risk register, and strategic decision recommendations with probability-weighted outcomes.
AI Transformation Roadmap	(Enterprise) Phased plan for AI integration across the business — what to automate, augment, or eliminate, department by department. Living document that updates as conditions evolve.

3.3 Quality Standards

The Plan phase outputs must meet the following non-negotiable standards:

Hyper-personalized: Every finding references this specific business, these specific numbers, these specific people and customers. Nothing generic.

Brutally honest: The system tells the business where it actually is, not where it hopes it is. Uncomfortable findings are surfaced, not softened.

Dollar-denominated: Every problem has a dollar amount attached. Every opportunity has a dollar amount attached. Vague findings are unacceptable.

Action-oriented: Every finding comes with a specific recommended action, a timeline, and an expected outcome. The system doesn’t just diagnose — it prescribes.

Scored and tracked: The Business Health Score provides the north star. The action plan provides the roadmap to 100. Progress is measurable.

3.4 Approval Gate

Before the system transitions to the Execute phase, the complete plan — Health Score, Issues Register, Strategy Documents, and Day-by-Day Action Plan — goes through a formal approval process. All relevant stakeholders review and approve the plan. This is a critical trust-building step: the system earns trust through its analysis before it earns authority to act.

4. PHASE 3: EXECUTE

Once the plan is approved, the system transitions to continuous execution. Five specialized agents are deployed under a central Orchestrator. The goal: the business begins running itself, with the agents executing the approved plan day by day, escalating decisions to humans when required, and adapting as conditions change.

4.1 The Agent Architecture

AGENT	ROLE	RESPONSIBILITIES
ORCHESTRATOR	Central Command & Coordination	Assigns daily tasks to all agents aligned with the action plan. Reviews system performance. Communicates with every stakeholder. Maintains the master task list, cron job schedule, and decision platform. Ensures all agent activity stays aligned with the approved strategy.
COACH	People & Performance	Monitors team health, engagement, and attrition risk. Facilitates retention conversations. Guides managers on performance issues. Tracks skills gaps and recommends development. Proactive intervention before problems become departures.
DEVELOPER	Technical Execution	Builds and maintains automations, integrations, and technical infrastructure. Implements process improvements identified in the plan. Develops custom tooling, dashboards, and reporting.
SALES & MARKETING	Revenue Growth	Executes pricing corrections, customer outreach, lead generation, campaign optimization. Acts on revenue leak findings. Implements upsell strategies. Manages competitive positioning.
TRANSFORMATION	Systems Design & Change	Drives the broader operational transformation. Redesigns processes, implements AI augmentation across departments. Manages the change management framework. Ensures the organization evolves as the plan demands.

4.2 The Orchestrator in Detail

The Orchestrator is the most critical agent in the system. It is the central nervous system that ensures every agent is on task, every task is aligned with the plan, and every stakeholder has visibility into what's happening and what decisions need to be made.

Orchestrator Functions

Planning & Task Assignment: Translates the day-by-day action plan into specific agent tasks. Distributes work across the five agents based on capability and current load. Re-prioritizes dynamically when conditions change.

Cron Jobs: Manages scheduled recurring tasks — weekly health score updates, cash model refreshes, competitive scans, customer health checks, board pack generation. These run automatically without human initiation.

Master Task List: Maintains a single source of truth for all active tasks, their status, their owners (human or agent), dependencies, and deadlines. Visible to all stakeholders through the decision platform.

Decision Platform: A stakeholder-facing interface where humans can see pending decisions, review agent recommendations, approve or reject actions, and maintain an audit trail of every decision made. This is the governance layer.

Observability: Full visibility into what every agent is doing, why, and what results it's producing. Includes performance metrics, confidence scores on recommendations, and deviation tracking against the plan.

Human Communication: The Orchestrator must have communication channels with every person in the organization. It is the interface between the AI system and the humans it serves. It escalates when needed, reports progress, and takes input.

4.3 Continuous Operation

After launch, the Execute phase runs continuously. The system is designed so that ideally, the business continues to run itself with progressively less human intervention as trust is established. The Orchestrator reviews the system, works with every person, and maintains communication with every stakeholder. The agents execute. The humans decide.

5. SYSTEM LIFECYCLE

5.1 End-to-End Flow

STEP	ACTION	DURATION	OUTPUT
1	Team members onboard via web portal — add credentials, upload files, connect channels	5–10 business days	Complete data corpus
2	Contribution window closes; Ingestion Agent begins processing	2–5 days	Structured business knowledge graph
3	Plan phase: Agent synthesizes all data into deliverables	5–14 days	Health Score, Issues, Strategy, Action Plan
4	Stakeholder review and approval of the plan	3–7 days	Approved execution roadmap
5	Execute phase launches: agents deployed, cron jobs activated	Day 1 of execution	Running multi-agent system
6	Continuous operation with human oversight via decision platform	Ongoing	Self-improving business operations

5.2 Trust Escalation Model

The system is designed with a progressive trust model. It starts advisory-only and earns autonomy through demonstrated accuracy:

Phase 1 (Advisory): No agent takes autonomous action. All outputs are recommendations for human review.

Phase 2 (Supervised): Agents can execute pre-approved action types (e.g. scheduling reports, sending internal alerts) with human notification.

Phase 3 (Autonomous): Trusted agents operate independently within defined guardrails. Humans are notified of actions taken and can intervene. Consequential decisions always require human approval.

6. DELIVERABLE SPECIFICATIONS BY TIER

6.1 SMB Tier — 8 Deliverables

#	DELIVERABLE	CADENCE	KEY METRIC
01	Business Health Score	Continuous, weekly digest	0–100 score across 5 dimensions
02	Cash Intelligence & Survival Forecast	Continuous, real-time alerts	13-week rolling cash model
03	Revenue Leak & Pricing Intelligence	Continuous, monthly deep dive	Dollar-denominated leak identification
04	Customer Health & Retention	Continuous, real-time churn alerts	60–90 day advance churn warning
05	Decision Intelligence	On-demand, hours turnaround	3-scenario structured brief per decision
06	Team Intelligence & Retention	Continuous, real-time attrition alerts	60–90 day advance flight risk warning
07	Competitive Intelligence	Weekly automated scan	Real-time competitor move detection
08	Growth Roadmap	Rolling 90-day, updated monthly	Top 3 priorities, sequenced actions

6.2 Enterprise Tier — 11 Deliverables (adds 3)

#	DELIVERABLE	CADENCE	KEY METRIC
09	Hard Truths Report	Quarterly + on-demand	Leadership beliefs vs. data reality audit
10	Board & Investor Intelligence Pack	Quarterly auto-generated	4 hours vs. 3–4 weeks production time
11	AI Transformation Roadmap	90-day / 6-month / 12-month	Department-by-department AI integration plan

Enterprise also includes: Risk, Compliance & Resilience Assessment (continuous, four-dimensional risk map with crisis scenario playbooks) and Decision Intelligence Briefs (on-demand with probability-weighted outcomes and historical precedents).

7. VALUE MODEL

7.1 SMB Impact ($3M Revenue Business)

VALUE SOURCE	ANNUAL IMPACT	TIMELINE
Pricing correction (10% uplift)	**$300,000**	Month 1–2
Customer churn prevention (1 retained @ $60K)	**$60,000**	Month 2–4
Bad hire avoided ($90K role)	**$90,000–$135,000**	Month 2+
Marketing waste eliminated (20% of $60K)	**$12,000**	Month 1–3
Cash crisis avoided	**$5,000–$25,000**	Month 1+
Owner time recovered (6hrs/wk @ $200/hr)	**$62,400**	Month 1+
TOTAL CONSERVATIVE YEAR 1	**$529K–$634K+**	

7.2 Enterprise Impact ($50M Revenue Business)

Conservative 7% revenue recovery from leak identification alone equals $3.5M annually. Combined with cash risk avoidance, attrition prevention, customer retention, and board reporting time recovery, the typical Year 1 impact exceeds 15–20x the platform cost. For a $200M business the numbers scale proportionally.

7.3 The 30-Day Pilot

Both tiers operate on the same principle: if the 30-day output does not identify more value than the cost of a full year of the platform, the client does not continue. The pilot pays for itself or the engagement stops. This is the go-to-market mechanism and the primary trust-building device.

8. TECHNICAL REQUIREMENTS

8.1 Infrastructure

Web Portal: Secure, authenticated web application for onboarding, credential management, document upload, and ongoing stakeholder interaction with the decision platform.

Agent Runtime: Container-orchestrated environment (Docker/Kubernetes) for running multiple concurrent agents with isolated execution contexts, shared state management, and fault tolerance.

Data Layer: Encrypted credential vault, document storage, vector database for semantic search across all ingested content, structured database for business knowledge graph, and time-series storage for metrics tracking.

Communication Layer: Integration with Slack, Teams, WhatsApp, email. The Orchestrator needs bidirectional communication with every stakeholder through their preferred channel.

8.2 Security & Compliance

Zero-retention for sensitive business data (not used to train shared models). Data residency controls configurable per jurisdiction. Full audit trail of every agent recommendation, the data it drew from, the confidence score assigned, and the human decision that followed. Explainability documentation for regulated industries.

8.3 Model Requirements

The Ingestion Agent requires a large-context model capable of holding the entire business picture simultaneously. Specialized agents may use smaller, task-specific models. All agents must support structured output, tool use, and multi-step reasoning. The system should be model-agnostic where possible to allow for upgrades as capabilities improve.

9. MINIMUM VIABLE PRODUCT (MVP)

The MVP is scoped to prove the core value proposition with a single SMB client in a 30-day pilot. It covers the minimum Ingest and Plan functionality needed to produce the flagship deliverables that sell the platform — the outputs that make a business owner say, “This found $230K I didn’t know I was leaving on the table.” The Execute phase is excluded from MVP; the first version is advisory-only.

9.1 MVP Scope

AREA	IN MVP	NOT IN MVP
Ingest	Document upload (PDF, Excel, CSV, Word), financial data import (Xero/QuickBooks CSV export or API), CRM data import (CSV or API), manual questionnaire for context the data doesn’t cover	Full credential vault, Slack/Teams live integration, WhatsApp connector, database direct access, real-time API sync
Plan	Business Health Score (0–100), Cash Intelligence (13-week model), Revenue Leak Analysis (dollar-denominated), Issues Register, top 3 at-risk customers, one Decision Brief	Day-by-day action plan generator, competitive intelligence (automated), team attrition prediction, board pack generation, AI transformation roadmap
Execute	None — MVP is advisory-only. All outputs are static deliverables for human review.	All five agents, Orchestrator, cron jobs, decision platform, continuous operation
Portal	Simple authenticated web app: file upload, basic questionnaire, output viewer with download	Multi-user onboarding, credential vault, role-based access, real-time dashboards, decision platform

9.2 MVP Deliverables

The MVP produces six outputs. These are the deliverables most likely to generate an immediate “this paid for itself” reaction from the client:

#	DELIVERABLE	WHY IT’S IN MVP	SUCCESS METRIC
1	**Business Health Score**	Anchor metric; makes the abstract concrete	Client says: “I’ve never seen my business scored like this”
2	**Cash Intelligence Report (13-week)**	Immediate survival value; finds problems before they hit	Identifies at least 1 cash timing risk the client didn’t know about
3	**Revenue Leak Analysis**	The money finder; highest emotional impact	Identifies ≥$50K in recoverable revenue (for a $1M+ business)
4	**Issues Register**	Comprehensive problem inventory creates urgency	Names ≥10 specific, dollar-denominated issues
5	**Top 3 At-Risk Customers**	Protects existing revenue; creates immediate action	Client initiates retention conversations within 48 hours
6	**First Decision Brief**	Demonstrates the “thinking partner” value	Client uses the brief to make or defer a real decision

9.3 MVP Architecture

The MVP simplifies the full architecture to the minimum viable stack:

Frontend

Authenticated web application with three views: (1) Upload — drag-and-drop file upload plus a structured questionnaire capturing what the data can't tell us (business model, key concerns, the one decision keeping the owner up at night). (2) Processing — status view showing ingestion and analysis progress. (3) Results — rendered deliverables with download as PDF/DOCX.

Backend

Single Ingestion-to-Plan pipeline: Not a multi-agent system yet. The MVP runs as a series of orchestrated processing steps (flows), not autonomous agents. This reduces complexity while proving the core intelligence value.

Step 1 — Parse & Extract: All uploaded documents are parsed (PDF OCR, Excel/CSV parsing, Word text extraction). Financial data imports are normalized into a standard schema.

Step 2 — Categorize & Structure: Each document is summarized, tagged against the predefined business schema, and stored in a vector database for semantic retrieval.

Step 3 — Synthesize: A large-context model receives the structured business knowledge graph plus all raw context and produces the six MVP deliverables. This is a single "mega-prompt" pass (or a small chain of prompts), not a multi-agent conversation.

Step 4 — Format & Deliver: Raw outputs are formatted into professional documents (PDF/DOCX) with the platform's branding and structure.

Data Layer (MVP)

File storage (S3 or equivalent) for uploads. Vector database (Pinecone, Weaviate, or pgvector) for semantic search across ingested content. Postgres for structured business data, user accounts, and session state. No credential vault in MVP — all data comes via file upload or CSV export, not live API connections.

9.4 MVP User Journey

DAY	USER ACTION	SYSTEM ACTION	OUTPUT
0	60-minute discovery call with platform team	Team captures context, identifies data sources, sets expectations	Onboarding checklist
1–3	Client uploads files: financials, CRM export, contracts, org chart, any strategy docs	Parse, extract, categorize all uploads	Processing status updates
3	Client completes structured questionnaire	Merge questionnaire context with document analysis	Complete business knowledge graph
4–7	Client waits (optional: answers clarifying questions from the system)	Synthesis agent produces all 6 deliverables	Draft deliverables for internal QA
7–10	Client receives deliverables; 30-minute walkthrough call	Present findings, answer questions, refine if needed	Final Health Score, Cash Report, Revenue Leak Analysis, Issues Register, At-Risk Customers, Decision Brief
10–30	Client acts on findings; weekly check-in calls	Track actions taken, measure early results	Progress tracking toward identified value

30	Pilot review: did identified value exceed annual platform cost?	Generate pilot summary with ROI calculation	Go/no-go decision on full engagement

9.5 MVP Build Estimate

COMPONENT	EFFORT	NOTES
Web portal (auth, upload, questionnaire, results viewer)	**2–3 weeks**	Next.js or similar; keep it simple
Document parsing pipeline (PDF, Excel, CSV, DOCX)	**1–2 weeks**	Use existing libraries; focus on reliability
Financial data normalizer (Xero/QB CSV → standard schema)	**1 week**	Start with CSV import; API connectors come later
Vector database setup + embedding pipeline	**1 week**	pgvector or Pinecone; standard RAG pattern
Business knowledge graph builder (categorize against schema)	**1–2 weeks**	LLM-powered categorization flows
Synthesis engine (mega-prompt → 6 deliverables)	**2–3 weeks**	The hardest part; prompt engineering + output quality iteration
Document formatter (structured output → branded PDF/DOCX)	**1 week**	Template-based generation
QA, testing, iteration on output quality	**2–3 weeks**	Run against test data; refine until outputs hit quality bar
TOTAL ESTIMATED BUILD TIME	**8–14 weeks**	With 1–2 full-time engineers

9.6 MVP Success Criteria

The MVP is successful if it achieves the following with the first pilot client:

Value identification: The platform identifies more recoverable value in 30 days than the annual cost of the platform. For a $1M–$5M business, that means finding at least $30K–$50K in revenue leaks, cash risks, or cost savings.

Emotional impact: The business owner has a “I’ve never seen my business like this” moment. The Health Score makes the abstract concrete. The Revenue Leak Analysis names specific dollars. The Cash Intelligence Report prevents a specific problem.

Action taken: The client acts on at least 3 findings within the 30-day pilot period. Findings that don’t drive action are findings that weren’t specific or urgent enough.

Conversion: The pilot converts to a full engagement. The client wants the continuous version — which justifies building the Execute phase.

Referral signal: The client would recommend the platform to another business owner without being asked. This is the strongest indicator that the value is real.

9.7 What MVP Proves

The MVP is designed to validate three critical hypotheses before investing in the full multi-agent Execute phase:

Hypothesis 1 — Data sufficiency: Can we produce genuinely valuable, hyper-personalized intelligence from document uploads and CSV exports alone, without live API connections or database access? If yes, the onboarding friction drops dramatically and the sales cycle shortens.

Hypothesis 2 — Output quality: Can the synthesis engine (a prompt chain, not a full agent system) produce deliverables that are specific enough, honest enough, and dollar-denominated enough to trigger real business action? If yes, the value proposition is proven and the sales documents write themselves from real case studies.

Hypothesis 3 — Willingness to pay: Will SMB owners pay for this after seeing the 30-day output? If yes, we have a business. If not, we learn why before building the expensive parts.

9.8 MVP to Full Platform — Graduation Path

Once MVP is validated, the path to full platform follows the build priority order:

PHASE	ADDITION	TRIGGER
V1.1	Live API connectors (Xero, QuickBooks, HubSpot, Salesforce) for continuous data refresh instead of one-time CSV upload	MVP validated; first 3 paying clients onboarded
V1.2	Automated competitive intelligence (web scraping, job board monitoring, pricing page tracking)	Clients ask for it; manual competitive research is a bottleneck
V1.3	Team attrition prediction + communication channel analysis (Slack/Teams integration)	Clients provide access; privacy framework approved
V2.0	Orchestrator agent + decision platform (the stakeholder UI for continuous operation)	Clients want continuous intelligence, not periodic reports
V2.1	Coach + Sales/Marketing agents (first execution agents)	Orchestrator stable; clients trust the system enough to delegate tasks
V2.2	Developer + Transformation agents (full agent roster)	V2.1 agents demonstrating value; clients requesting deeper automation
V3.0	Enterprise tier: Board pack generation, Hard Truths Report, AI Transformation Roadmap, Risk/Compliance	SMB tier profitable; enterprise pipeline building

10. BUILD PRIORITIES

10.1 Critical Path

PRI	COMPONENT	DEPENDENCY	PHASE UNBLOCKED
P0	Onboarding portal (auth, upload, credentials)	None	Ingest
P0	Ingestion Agent (read, summarize, categorize, synthesize)	Portal	Plan
P0	Business Health Score engine	Ingestion Agent	Plan
P1	Day-by-day action plan generator	Health Score + Issues	Plan → Execute
P1	Orchestrator agent	Action plan	Execute
P1	Decision platform (stakeholder UI)	Orchestrator	Execute
P2	Coach agent	Orchestrator	Execute
P2	Developer agent	Orchestrator	Execute
P2	Sales/Marketing agent	Orchestrator	Execute
P2	Transformation agent	Orchestrator	Execute

10.2 Key Design Decisions Still Required

1. Agent framework selection: Choose between building custom agent orchestration vs. adopting an existing framework (LangGraph, CrewAI, AutoGen, or custom). The Orchestrator's requirements for cron scheduling, task assignment, and human-in-the-loop governance may push toward a custom build.

2. Communication architecture: Define how the Orchestrator communicates with humans — is the decision platform the primary interface, or do agents also push to Slack/Teams/WhatsApp directly? Likely both, with the web platform as the system of record.

3. Model selection per agent: The Ingestion Agent likely needs the largest context window available. Execution agents may work with smaller, faster models. Define the model strategy per agent role.

4. Credential security model: The system needs production database access, API keys, and communication channel credentials. The security architecture for storing, accessing, and auditing use of these credentials is a critical trust requirement.

5. Pricing model: Both documents reference the platform replacing $58K–$220K (SMB) and $980K–$3.45M (Enterprise) in existing spend. The actual pricing needs to be defined against these benchmarks.

END OF DOCUMENT
